All You Need To Know About Scannable Fake Ids

September 22, 2022 2

To determine if a fake ID is “Scannable,” you need to know how an ID scanner works and what tools fakers use to get around these tests. You need the right set of things to use an ID scanner to catch fake IDs. Reliable tests look at even the smallest parts of an ID to ensure it is correct.

For checking IDs, the most important things are pattern matching and a strong scanning engine. Even ID scanners with the right mix of hardware don’t always keep their libraries up to date, which can cause problems with reliability, false positives, and IDs that can’t be read.

Taking everything into account, will a **fake id** work? The fact is that most ID scanners say “yes.”

Data written on the card itself should match the data read from the barcode and magnetic strip.

Your name, date of birth, address, height, weight, eyes, hair, issuance and expiry dates, and license number are all encoded in the **barcode and magnetic stripe** on your driver’s license. This data is shown understandably on the ID card scanner’s screen, and the transaction is recorded in a database.

The data encoded on the ID card’s magnetic stripe or barcode often does not correspond with the data printed on the card’s front. Now it’s up to whoever’s operating the ID scanner to notice the discrepancy and conclude that the ID card is a fake.

To get the most out of an ID scanner, the user must be familiar with the information it can and cannot provide.

Most Fake ID makers are not reliable.

Commonly, those who produce false IDs will simply print new information on the face of the card. Fake ID manufacturers often buy cards in bulk that have already been encoded and then print new details on the front, such as a new name, address, or birth date. Minors are targeted with advertisements for these cards, which promise they can scan but contain information that does not match what is displayed on the card. If the data on the front of the card does not match the data stored in the card, the ID will likely be identified as fake when scanned.

If an ID scanner checks a license number, does it go through a state database?

This is a common misconception, but ID scanners bought from stores do not check the license number against the state database. The public does not have access to databases the state holds, such as those with license information. An ID scanner will record your license number and other information as proof that your age was checked, but it won't check the number against any state databases. Authorities are the only ones who can check if a license number is real.

If a fake ID is made right, it will scan as "real."

With the right tools and encoding schemes, making barcodes and magnetic strips with encoded identity information is not hard. These tools and techniques are easy to find on the internet.

Commercial ID scanners can catch fake IDs, but it's rare for top phony id makers to make IDs with broken barcodes or magnetic strips. When scanned, all fake IDs sold on the most popular websites will be valid.

Most ID scanners used today only use these tests, so most fake IDs pass when scanned.

Meanwhile, Illegal ID sellers and ID verification services engage in a mutually beneficial dance behind the scenes, with sellers buying scanning equipment to make sure their illicit wares are functional and sellers buying the newest phony IDs to put their services through their paces. "There are knowledgeable individuals on both sides," Don Lawrence, Bar & Club Stats president, stated. The number of false IDs detected by his program after the upgrade in January startled him, but so did the size of the fake ID underground industry.

Fluorescent Overlays and Holograms

ID scanners also add a layer of security because they can check how reflective the ID is in different lighting conditions. Holograms and fluorescent overlays are used to do this.

White light or UV light tests can check IDs with extra security features like holograms or fluorescent overlays.

Since these security measures can be checked with low-tech methods, the current forger will try to copy them as closely as possible. Fraudsters copy these security features or take them from real IDs so they can pass these checks.

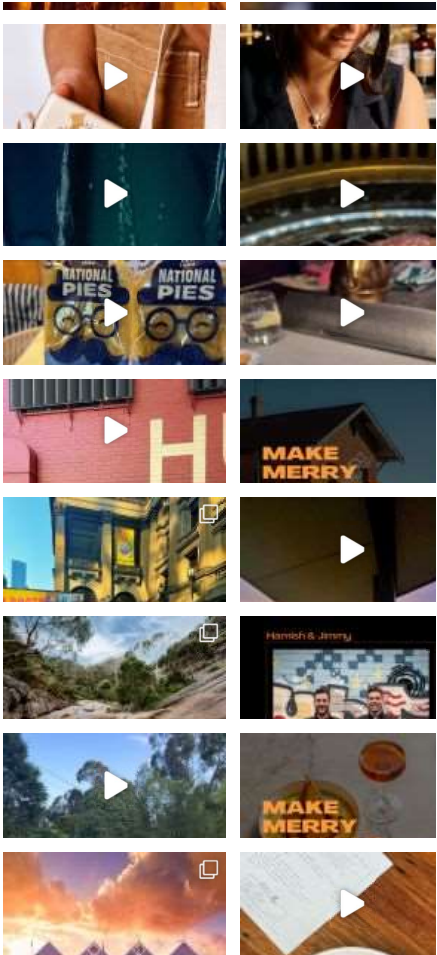

How well a fake ID can fool an ID scanner's lighting test depends on the quality of the fake ID and the level of sophistication of the scanner. For more complicated fake IDs, tests like holograms and fluorescent overlays may be duplicated, so relying only on these tests could be flawed.

Thus, to sum up

Poorly forged safety features are easy to see for a skilled eye. Yet sophisticated fakes readily fool humans, making ID scanners the sole viable **method for detection**. Powerful scanners use pattern-matching technologies to examine IDs meticulously, to the point that just a few pixels give away a fake.

Few ID scanners can identify fake IDs by comparing the scanned ID's typefaces, images, and spacing to a database of legitimate IDs. Pattern matching is the term for this analysis.

More fake documents are available on the dark web, playing a role in significant identity theft cases. ID scanners prevent identity theft, but a weak scanning engine might let a false ID through.
